Auto Convert TV-Shows and Movies to MP4 (Sonarr and Sabnzbd)

Auto Convert TV-Shows and Movies to MP4 (Sonarr and Sabnzbd)

Post by BrooBee » October 15th, 2016, 12:28 pm

Here is a script that converts files to MP4, rename them (Movies through Sabnzbd's Sorting and TV-Shows through my setup in Sonarr) and move them where you want.

Download Timer.exe from <http://www.gammadyne.com/cmdline.htm#timer> a simple dos program to calculate time for a command to process, change Folder where you put timer.exe (Timer is Optional) Setup your sonarr as you want it with TV-Shows. Setup your Sabnzbd as you want it. Make a file with the above code and put the file in Sabnzbd's Script folder. (C:\Program Files (x86)\SABnzbd\scripts\) Setup your Categories in Sabnzbd (TV-Shows and Movies) and point to the script file you made. Setup Sorting in Sabnzbd if you want.

TV-Shows will be converted to MP4 and Sonarr takes care of the renaming and moving of files. Movies will be converted to MP4 and Sabnzbd will take care of the renaming (if you use sorting) and moving files.

It is easy to change so it suits your wishes, files to delete Before converting, how to convert it, files to delete after etc.

Essential Listening: 10 Stellar Headphone Albums.

What, exactly, is a headphone album? Well, the definition changes depending on who you are.

For audiophiles, a headphone album is a work that is so exquisitely recorded that it demands you listen to each beautifully recorded note under a sonic microscope. Miles Davis' Kind of Blue fits that bill.

For others, a great headphone album is one that makes an intimate album more intimate (such as Bob Dylan's original mono recordings), or a loud album louder (Rage Against the Machine's debut album).

We're an unsubtle and hyperactive bunch at Guitar World , so our favorite headphone albums are those that have a lot of activity in the stereo field. As dumb as it sounds, we love it every time a guitar solo takes a shortcut through our skulls as it zooms from one ear to the other.

If you don't know what we're talking about or you've never experienced any of these great albums under the influence of some high-end ear buds, we suggest you go home, put on your best set of 'phones, turn out the lights, turn up the volume and prepare to have your mind blown sky high.

The Jimi Hendrix Experience, Electric Ladyland (1968)

If you haven't taken LSD, the good news is you don't have to. Save your brain cells and listen to this masterpiece under a good set of headphones to get the complete psychedelic picture. On Electric Ladyland , Jimi Hendrix and his brilliant engineer, Eddie Kramer, create a wonderful, three-dimensional sonic world and invite you to step in. This album is not necessarily stoned, but it certainly is beautiful.

Pink Floyd, The Dark Side of the Moon (1973)

TICK TOCK, TICK TOCK. DING DONG! BRRRRRRRANG. WIIRRRRRRRLLLLLLLLYYYYYYY WHIRL...HA HA HA HA! I mean, what else can you say about the Citizen Kane of headphone albums?

The Edgar Winter Group, They Only Come Out At Night (1972)

This is a little on the obscure side, but it ranks right up there with Dark Side as an essential Seventies listening experience. The star of the show is the extended version of the hit instrumental "Frankenstein," but almost every song on the album is a sonic thrill ride.

Santana, Caravanserai (1972)

This album was originally mixed and released in both stereo and quadrophonic. Designed to be an all-encompassing, complex and exotic listening experience, the percussion surrounds you while the soaring guitars lift you to the heavens. This is the best-recorded album of Carlos Santana's career, and probably his best album overall.

Dukes of the Stratosphere, Psonic Psunspot (1987)

The Dukes of the Stratosphere was a pseudonym used by the British rock band XTC in the mid-to-late Eighties, and their Psonic Psunspot album was a brilliant homage to the Sixties psychedelic pop of the Beatles, Pink Floyd and the Zombies. While the project was a bit of a joke, the songs are brilliant and, due to advancements in recording technology, the sound of the album eclipses anything actually recorded in London in 1967.

The Cure, Disintegration (1989)

They say that guitarist Robert Smith was using hallucinogenic drugs throughout the course of this beautifully textured album. Like Hendrix's Electric Ladyland, the sound of the album reflects his trippy state of mind. Listening to Disintegration under headphones is like stepping into someone else's dream—and a rather dark one, at that.

Radiohead, Kid A (2000)

In the late Nineties, Radiohead wanted to shake up their music. Their solution was to work as a collective—one that would make interesting "sounds"—rather than with each person in band playing a prescribed role. The result was an album that sounded unlike anything else before or since. This philosophy extended to the album's sumptuous mix, which can only truly be truly appreciated with a pair of speakers right next to your ears.

Tool, Lateralus (2001)

In 2005, four years after its original release, Tool's Lateralus was released as a limited-edition two-picture-disc vinyl LP in a holographic gatefold package. It took them a while to do it, but they were finally able to create a package that adequately reflected the multi-dimensional music offered inside.

Dream Theater, A Dramatic Turn of Events (2011)

While everything sounds "good" these days, it's hard to find albums that sound "great." Everything is engineered so loud and compressed that most modern recorded music lacks the kind of space and depth that allows for a true headphone experience. Dream Theater probably doesn't really give a damn about what is happening in popular music, which is why this album sounds as good as it does.

The Beatles, Abbey Road (1969)

Every collection has to have some Beatles, and this is by far their best and most modern-sounding album. Enjoy.

I don't know if its possible with sabnzbd but there is a rar player that plays rar files while downloading. <http://ds6.ovh.org/drp.html> have made something.

It would be very very very cool when something like this below work. - I choose some demo movie to download (let's say something about 4GB) - then in the queue list I choose a option like 'try to stream this' - then I see in the variable directory for example /downloads/streams/stream1.mpg (1stream at the time)

Then I can see the movie by clicking /downloads/streams/stream1.mpg in windows and I don't have to wait till the 4GB is downloaded. (now its even possible to see what you get, before download the rest)

In my situation I can go to step 2 and that is. - share the /downloads/streams/stream1.mpg (in windows) - go to the living room, turn on my xbox - start xbmc and play the share /downloads/streams/stream1.mpg !

or - put the 'stream' on my nas disk and play it with xbmc or on other pc's while downloading.

This will not work for slow connections (they have to wait longer, before the stream will work) but the fast connection will get this cool feature.

I've been searching high and low for a post-processing script that once a file is downloaded, it will make a torrent of the file and upload it to a local server I have running on my internal network. Reasons for something like this is some files get auto downloaded at like 5am so I'm usually asleep once it's done so am unable to upload it and would like to have it up asap so all the guys on my network can grab it straight away.

Currently I'm using utorrent as my client.

I don't have much knowledge with scripting so would really appreciate it if someone could come up with this sort of script as Im sure there are more guys looking for something like this.

I have also used the search function and it didn't return anything for my query.

If you mean have i ever created these torrents manually. yes but at 5am I'm unable to do so since im asleep.

Torrent Client: uTorrent 2.0.2.

I assume these are the details you are asking.

So basicly you want an autoupload script to your tracker that does : ?

\* Watch for new connect in a folder or start the script after download is done \* Make a .torrent of a folder \* Upload the .torrent to your torrentwebsite \* download the upload .torrent to your utorrent & start seeding ?

If so .. this is not very easy to make . some private sites have it .. but it costs a lot of money (just search for it on the web , ad you will see the prices)

For Sickbeard help go here :

Yup, that's basically it. A guy on my network has a script which he made for another sabnzbd server running on the network but for some reason doesn't want to share it. I'll just keep looking, if i find one I'll post it here.

Sounds not too difficult. Pseudocode:

Re: Auto-Upload to torrent server.. help??

Post by markus101 » August 19th, 2010, 5:47 pm

Doesn't seem to be too impossible, might be a bit more than 10 lines + debugging in C#, but if I get a chance I'll give this a shot.

I assume this is all Windows based? If not I'm barking up the wrong tree.

Re: Auto-Upload to torrent server.. help??

Post by markus101 » August 20th, 2010, 10:27 pm

-Create a Torrent -Optionally send it to uTorrent.

Set your variables and you're off. If you want support for uploading to a server, let me know how the transfer needs to work. local file system, SMB (Windows Share), FTP and I'll see what I can do.

For TV Shows the created torrent would contain all the files in the season folder (assuming season sorting is enabled and the video files all end up in the same directory). Let me know how it works for you, I did some testing and so far so good, but please let me know if you find any issues.

Re: Auto-Upload to torrent server.. help??

Post by rascalli » August 21st, 2010, 3:15 am

That looks good.

Normally you need to upload the .torrent by html Add info about the torrent (most is in nfo) Then redownload the .torrent again And start seedng that downloaded torrent in your client.

Thanks for the script, looks really good. As for support for uploading, it seems a similar guy has just used a make torrent script like yours and somehow his utorrent watches a folder for new .torrent files and uploads it to the torrent server. I'll see if i can google this.

Torrent creation works like a charm. now anyone know where a windows script to upload a torrent and then re-download it can be found. google is proving fruitless.
