

can't download with mod manager

Fix: Nexus Mod Manager not Downloading.

The Nexus Mod Manager (NMM) is a free and open source piece of software through which you can download, install, update and manage your mod files. It integrates with the Nexus sites to provide you with a fast and much less hassled modding experience.

However, several users are getting into a situation where you go to “Nexusmods” site and try to download any mod files by clicking the button “Download with Manager” and it does a little loading but Nexus Mod Manager just won’t download the clicked file.

What Causes the Nexus Mod Manager to not download?

We investigated this particular issue by looking at various user reports and the repair strategies that were used for resolving this particular problem. Based on what we gathered, there are few common reasons that are known to cause this issue for the users:

Nexus Mod Manager Settings Bug : Mostly this issue is caused by the Manager settings. This bug happens because of the manager not associating with the nxm URLs and is unable to accept any of the download file links. **Browser Settings :** The second reason this can happen is because of your browser settings for the nxm. An option for nxm must not be selected or selected wrong due to which the manager is not able to download any of the mod files.

Now that you know what is causing this issue, let’s move towards the methods that will help you resolve this problem.

Method 1: Associate with NXM URLs:

This method is focused on the settings of Nexus Mod Manager where you will find the option about associate with nxm URLs. Sometimes this particular option will be the bug for the problem and not letting manager communicate with nexus URLs that you are trying to download. So to fix this follow the steps below:

Open “Nexus Mod Manager” by double-clicking the shortcut and go to “Settings”. In the General tab at the top, you will see “Associate with NXM URLs”. If this is grey out, close the Nexus Mod Manager. If the option is grey and can’t click, close the manager. Right-click on the NMM shortcut icon and choose “Run as Administrator”. Go back to the “Settings”, and uncheck the “Associate with NXM URLs” (if it’s already checked). Close settings, then again open settings and check the box back uncheck the associate with NXM URLs then check it again. Try if you are now able to download through NMM.

Method 2: Checking Firefox for NXM Preferences.

In this method, we will be checking the Firefox browser settings related to the Nexus mod manager. There can be a possibility for the nxm to be associated with a wrong application or none selected in your settings. Changing the settings for nxm will resolve this issue of unable to get downloads in the manager from the website. Steps for checking and fixing this option are:

Launch “Firefox” by double-clicking the shortcut and go to “Options”. Select the “Applications” tab on the left-hand side and then select “Nexus Mod Manager” for nxm in the list. Selecting nexus mod manager for nxm in Firefox application settings. If NMM is not in the drop-down list, choose “Use Other”. Click “Browse”, and select the “NexusClient.exe” in the installed folder. Firefox Setting – Selecting NMM for nxm. Now go and try downloading through NMM.

Method 3: Using Vortex (An Alternative)

If the Nexus Mod Manager still doesn’t work, then switching to Vortex can be helpful for downloading mods. Vortex is the nice middle ground between Nexus Mod Manager (NMM) and Mod Organizer (MO). It has a few features that are better and not available on the other ones. Vortex has moved from the alpha, beta testing phase, and is now available with a full release.

Vortex the alternative for Nexus Mod Manager.

With NMM if you install two mods you will get no indication as to which was set to override the other, which will make conflict. For Vortex, it will inform you about the existence of a file and its conflict in your load order. Also provides the ability to change the settings about which mod should win the conflict by going last, without needing to reinstall and the program informs you about the presence of a file conflict in your load order.

r2modman.

It’s quite simple really, a mod manager is an application to make it easier to control which mods you have installed.

You can choose to update, enable/disable or even uninstall mods with a simple click, all whilst keeping it available on another profile.

Installing.

First time installing.

Windows.

Click "Manual Download" on Thunderstore. Inside the downloaded .zip file. Run the "r2modman Setup X.X.X.exe" (where X.X.X is the current version). Follow the steps in the installer.

Linux.

Click "Manual Download" on Thunderstore. Inside the download .zip file there is an AppImage release.

If you'd prefer to install platform specific builds then you can find them under the latest GitHub release on the ebkr/r2modmanPlus repository.

Platform builds: - deb - rpm - pacman - tar.gz

Problems with Linux builds should be reported in the r2modman discord.

Updating.

r2modman will automatically download any available updates whilst you use it.

If an update has been downloaded, it will be installed once you have closed the application.

Manager errors:

Check the wiki. If you can't find the solution, join the community modding discord and ask for help in the appropriate channels.

Mod errors:

Join the relevant community modding discord and ask for help in the appropriate channels.

Feedback and suggestions.

It's encouraged to provide as much feedback as you'd like, and fully open to criticism.

Suggestions are welcome and there are already some suggestions that have made it in to the manager! From small features such as always-expanded cards, all the way to larger features such as code-based profile exports.

The only thing you have to consider when suggesting a feature is the impact it will have on users who don't have a lot of experience with computers.

Changelog

Added Muck support.

Added support for ROUNDS and Mechanica. Overhauled local imports. Manifest files are no longer required! r2modman's Manifest V2 is now considered deprecated and should not be used if possible. Alternative implementations should rely on file name (Author-ModName-Version or Author_ModName_Version), or a Manifest V1 (with an author field if not inferrable from file name). RainOfStages maps can now be disabled correctly.

Added support for H3VR. Dedicated servers for Risk of Rain 2 and Valheim are now supported. Note that on Linux, Valheim Dedicated Server is unable to be launched vanilla and will require parameters to be removed if required (Steam issue).

Screenshots.

Installed mod view.

Available versions.

Please note that the install buttons only work if you have compatible client software installed, such as the Thunderstore Mod Manager. Otherwise use the zip download links instead.

Always backup ANY FILES you modify. If you download this software you agree that you do not hold me liable if you screw up and have to re-install the game.

Do you have modded RPF's manually placed in your GTA Directory instead of using this manager? This manager will clean out ALL MODS when pressing GTA:Online, so either move your RPF's to your GTAV Mod folder or they will be deleted. :

For fastest response if you need help, please contact me here.

Please see this thread for in depth details on using this manager.

Basic guide on how place the Mods in Mod manager. I personally prefer Folder mode for more clean approach.

Basics = Things you need to use any of the LUA\ASI\Rage\NIB's\Dot NET Mods.

Thunderstore "install with mod manager" not working #5.

The download with mod manager button on the thunderstore doesn't function correctly. When pressing the button my firefox came up with a page saying ror2mm protocol isn't recognised.

I manually entered the protocol and pointed it at the r2modman.exe in the bin folder, but when i press the download with mod manager button it opens a new mod manager window which is missing my profile and no mod is downloaded.

Installing mods manually or from within the available mods tab and running the game works perfectly however.

Installing A Mod With FOMM.

Fallout Mod Manager is a tool used to manage your load order and install mods correctly. Fallout Mod Manager is available on the nexus.

Installing a .FOMOD file.

Once FOMM is installed all you have to do to install a .FOMOD file is double click the .FOMOD file in its directory, go to package manager in FOMM and click the mods name on the list and the click activate.

The mod may or may not open a custom installer which should have instructions on how to configure the mod to your liking.
