How to Use Google Photos to Store an Unlimited Amount of Photos.

Google Photos offers unlimited storage for your photos and videos, a slick website, and automatic-upload apps for Android, iPhone, Windows, and Mac. It's a great option for storing your photos.

This photo-storage service was previously trapped in Google+, so it was overlooked by many people. It's no longer part of Google+ and has a new interface — you just need a Google account.

You Need a Plan for Storing Your Photos.

Google Photos compares favorably with similar services like Apple's iCloud Photo Library, which only offers 5 GB of free storage and isn't as convenient to use on the web or Android. Yahoo!'s Flickr is compatible, and Dropbox and Microsoft's OneDrive also offer photo-storage features although they focus more on general file storage.

Whichever service to use, you should be storing your photos somewhere safe and secure. Don't just copy all your photos to an external drive or keep them on your computer. You need a backup because it's impossible to replace them if your hardware ever fails.

Get Your Photos Into Google Photos.

To get photos into Google Photos, you can just visit the Google Photos website on your computer, sign in with your Google account, and just drag-and-drop them onto your browser window.

You may want to open the menu and select Settings first, however. Choose "High quality" and you'll be able to upload an unlimited amount of photos. Select "Original size" and you can upload larger photos without having them shrunk, but they'll take up some of your Google account's storage quota. High quality photos can be up to 16 megapixels in size, and Google really only recommends you use the "original size" setting if you have higher-detail images from a DSLR camera.

Photos you place in your Google Drive storage will also appear in Google Photos by default.

You can also use apps to automatically upload photos you take from your smartphone, tablet, Windows PC, or Mac. Download them from Google.

iPhone and iPad : Install the Google Photos app. It can automatically upload photos from your camera roll, taking the place of iCloud Photo Library and saving you iCloud storage space. Android : The Google Photos app allows you to set up automatic uploads of your photos. This may already be installed on your Android device.

As when uploading via the web, you'll probably want to store photos in "high quality" unless they're from a DSLR camera and you're willing to pay for additional storage.

You can also upload videos to here. Videos in 1080p resolution or below can be stored for free.

Browsing Your Photos.

To view photos, just visit the Google Photos website or use the Google Photos apps for Android, iPhone, or iPad. You can scroll through your photos and click or tap them to quickly view them. Photos are ordered in a list from most recent to oldest.

As you might expect, Google Photos also includes sophisticated search technology. You can search for "dog" and you'll see images that Google thinks contain dogs, for example. You can also search for landmarks, different types of objects, locations where you took photos, and so on.

Click the search bar once and you'll see a list of different people — Google doesn't know who they are, it just knows the faces in certain photos look similar — and locations photos were taken, making it easier to browse related photos.

If you want to organize your photos in a more traditional way, you can also use the "Collections" option to organize your photos into albums.

Click around and you'll find other features, like the "Assistant" that creates animations and montages for you and allows you to save them if you like them.

Share With Anyone.

Thanks to it no longer being integrated into Google+, Google Photos has excellent sharing features. Sharing an image is as simple as viewing it, clicking the Share button at the top of the screen, and selecting one of the options.

You can share the photo to Facebook, Twitter, or Google+. You can also just click "Get Shareable Link" and you'll get a direct link to the photo. Give that link to anyone else — via an instant message, email, or any other way — and they can just view the photo without even having to log in.

You can open the Google Photos menu and select "Shared Links" later to view and manage these shared links.

Google Photos also allows you to download the photos if you want them, either one at a time or your entire photo collection via Google Takeout. This allows you to keep an offline backup, if you like.

It's now integrated with Google Drive, too — photos you take on your phone can be automatically uploaded to Google Photos and downloaded to your PC via Google Drive, just as Dropbox and Microsoft OneDrive work.

This is a successor to both Google's Picasa Web Albums and Google+ Photos. If you previously used either of those services, the photos you stored there are now stored in Google Photos.

Download google photos app for pc.

Completing the CAPTCHA proves you are a human and gives you temporary access to the web property.

What can I do to prevent this in the future?

If you are on a personal connection, like at home, you can run an anti-virus scan on your device to make sure it is not infected with malware.

If you are at an office or shared network, you can ask the network administrator to run a scan across the network looking for misconfigured or infected devices.

Another way to prevent getting this page in the future is to use Privacy Pass. You may need to download version 2.0 now from the Chrome Web Store.

A Highly Advanced Scanner App You May Use For Free.

Scanning and taking photo images will create very different results. Your phone cannot make scans of images but with the PhotoScan by Google app you may.

How (and why) to use Google Photos on your iPhone or iPad.

Many iPhone users have wrestled with storage limits, especially when it comes to managing the device's camera roll. Apart from deleting old pics and purchasing a paid iCloud subscription, there's another option for alleviating storage woes: using Google Photos for iOS.

Below, we provide instructions for backing up all of the photos on your phone to Google Drive via the Google Photos for iOS app, so you can delete them from your phone (and the iCloud) as needed.

Download & install the app.

The Google Photos for iOS app is free. Download and install the app on your iPhone or iPad. When you launch it for the first time, you'll be asked to sign into your Google account.

If you've used any other Google services, including Gmail, use the same credentials. If you have more than one Google account, choose carefully. Make sure you're selecting the account you want to associate your photo library with for the long term.

Back up & sync for the first time.

Next, you'll encounter the Back up & sync screen. Here, you'll set your preferences for how the photos saved on your device should be uploaded to the Google Drive cloud. The app walks you through the steps.

Here, switch the "Back up & sync" toggle to the blue on position. Whether you wish to enable cellular data for this sync and future syncing is up to you, but we recommend leaving it off (assuming you have access to a Wi-Fi network) so you don't inadvertently put a strain on your data plan. You can always change this and other settings later. Hit Continue.

Launching Google Photos for iOS for the first time.

The next screen asks you to confirm upload size. Here, you should choose "High Quality" for two reasons. One, photos uploaded at this size do not count against the 15 GB of free Google Drive storage associated with your Google Account. Two, it won't affect the quality of the photos you've taken on your iPhone: The high quality option compresses photos to a 16 MP maximum, but at this point, all iPhones already take photos at 16 MP or smaller.

Once you hit continue, the back up & sync process begins (presuming you are on a Wi-Fi network or using cellular data). The more photos you have, the longer this automated process will take, so don't be worried if it takes a while to finish up.

Confirm uploads, explore Google Photos.

Once you're finished, it's time to familiarize yourself with the Google Photos interface. When you open the app again, you'll have access to your photo and video content through three tabs: Assistant, Photos and Albums.

Under Photos and Albums, you can peruse and organize your content. In addition, the Assistant screen has a few organizational shortcuts (Create Album, Collage, Animation, Movie, etc.) for easy searching, sharing and editing. Below, you'll see a feed of auto-created content that Google Photos generated from your photos and videos. You may see animations, edited photos, collages and more.

Assistant view, Google Photos for iOS.

To access your photos from a computer, just navigate to Google Photos in your browser and sign into your account. There, you can see your content and an expanded version of the mobile interface anytime, anywhere. You can also download or share photos as needed.

Free up storage on your iOS device.

Once you're satisfied that your iOS device's photos have been uploaded to your Google Photos account, you're ready to delete them from your phone or tablet. You can either do this piecemeal through Apple's Photos app, or you can use a built-in Google Photos tool to do so all at once.

To use Google Photos, open the app and tap the three-line menu icon on the top left portion of the screen. Select "Free up space" from the menu. From there, Google Photos detects images and videos saved on your local device that have already been backed up by Google. You'll receive a notification asking to confirm the removal. Once you're ready, hit Remove.

Making space with Google Photos' built-in tools.

The only downside of removing these photos from your local device is that you will not be able to share or post them directly from apps like Messages, Mail or social media. However, you can do all of these directly through Google Photos: Open the app, Tap "Photos", then select the item you wish to share. Tap the square sharing icon in the lower left hand corner and make your selection.

Sharing directly from Google Photos.

You can also download or delete individual items from your local device on at a time. After you select the image in question, tap the three-dot menu icon in the upper right corner. If the image is already on your device, you'll see a "Delete from device" option. If it's not, you'll see "Download" instead.

Using Google Photos to replace the iCloud Photo Library.

After you've uploaded your photo library to Google Photos and cleared up space on your device, you can either go back to using the built-in iOS photo library and tools, or you can use Google Photos to replace the iCloud Photo Library.

If you just want to do a one-time backup to Google Photos, then turn off the "Back up & sync" function in Google Photos. Open the app on your device, then go the Menu > Settings > Back up & sync. You can always do another backup if you run into more storage issues.

Back up & sync settings, Google Photos for iOS.

If you leave "Back up & sync" on, Google Photos automatically syncs photos from your camera roll to the cloud when you launch the app. In this way, it provides convenient cloud storage similar to the iCloud but with fewer constraints. Most notably, you'll never run out of storage, as long as you're uploading in high (rather than full) quality.

Other advantages? If you ever decide to switch to Android, it will be easy to access all of your photos on your new device. Also, Google Photos' automatic organization tools are arguably more accurate, and more fun to use, than those in Apple Photos.

If you have Google Photos continually backing up and syncing, it's safe to turn off the iCloud Photo Library on your device (Settings > Photos & Camera > iCloud Photo Library). This frees up your iCloud for essentials like device backups, so you can keep using your beloved iPhone without being subject to Apple's stingy cloud policies.

Softonic in:

The name and logo of Softonic are registered trademarks of SOFTONIC INTERNATIONAL S.A. Copyright SOFTONIC INTERNATIONAL S.A. © 1997-2021 - All rights reserved.

In Softonic we scan all the files hosted on our platform to assess and avoid any potential harm for your device. Our team performs checks each time a new file is uploaded and periodically reviews files to confirm or update their status. This comprehensive process allows us to set a status for any downloadable file as follows:

It's extremely likely that this software program is clean.

What does this mean?

We have scanned the file and URLs associated with this software program in more than 50 of the world's leading antivirus services; no possible threat has been detected.

This software program is potentially malicious or may contain unwanted bundled software.

Why is the software program still available?

Based on our scan system, we have determined that these flags are possibly false positives .

What is a false positive?

It means a benign program is wrongfully flagged as malicious due to an overly broad detection signature or algorithm used in an antivirus program.

It's highly probable this software program is malicious or contains unwanted bundled software.

Why is this software program no longer available in our Catalog?

Based on our scan system, we have determined that these flags are likely to be real positives.

We'd like to highlight that from time to time, we may miss a potentially malicious software program. To continue promising you a malware-free catalog of programs and apps, our team has integrated a Report Software feature in every catalog page that loops your feedback back to us.

Flag any particular issues you may encounter and Softonic will address those concerns as soon as possible.
