

download ios 13 beta 5

How to download the iOS 13.7 beta 1 to your iPhone.

iOS 13.7 is on its way with new features that require third-party developer input. As such, the company is releasing developer betas so that software engineers can get a head start on making great software for you.

Are you trying to download the developer beta of iOS 13.7 using macOS Catalina? The steps are different. Check out our guide!

Apple occasionally offers updates to iOS, iPadOS, watchOS, tvOS, and macOS as closed developer previews or public betas. While the betas contain new features, they also contain pre-release bugs that can prevent the normal use of your iPhone, iPad, Apple Watch, Apple TV, or Mac, and are not intended for everyday use on a primary device. That's why we strongly recommend staying away from developer previews unless you need them for software development, and using the public betas with caution. If you depend on your devices, wait for the final release.

What's new in iOS 13.7?

August 26, 2020: Apple releases iOS 13.7 beta 1 to developers.

Apple has just released the first beta version of iOS 13.7 for developers. Follow the instructions below to install this beta. If you were waiting for iOS 13.6 to get started with beta testing, go ahead and download the latest version.

Apple has just released the second beta version of iOS 13 for developers. Follow the instructions below to install this beta. If you were waiting for iOS 13 to get started with beta testing, go ahead and download the latest version.

June 3, 2019: Apple releases iOS 13 beta 1 to developers.

Apple has just released the first beta version of iOS 13 for developers. Follow the instructions below to install this beta. If you were waiting for iOS 13 to get started with beta testing, go ahead and download the latest version.

Everything you need to know about iOS 13.

You can find out more about all the new features in iOS 13 here.

How to make an archived backup of your iPhone.

Before you begin, make sure you back up your iPhone. While the beta process is fairly straightforward, any time you make any significant change to your device you risk problems. And with your personal data, it's always — always! — better to be safe than sorry. Even if you back up every night, you'll want to make sure it's absolutely up-to-date.

Plug iPhone into your Mac or Windows PC. Launch iTunes . Click on the iPhone icon in the menu bar when it appears. Make sure backup is set to This Computer . (And enable Encrypted backup — it's worth it!) Click on Back Up Now . (Click on Encrypt Backup and add a password — you want the security.) Back up Apps , if asked.

Archiving will prevent your current backup from being overwritten by an iOS 13 backup in the future, should you want to revert for any reason.

How to install the iOS beta using iTunes.

Go to developer.apple.com on your Mac. Click on the "Discover" tab. Click on one of the operating system buttons in the bar near the top of the screen. Click Download . Log in with your developer account's username and password. Go to the iOS 13 beta section and Download Restore Images . Click on the iOS restore image that matches the device onto which you plan to install it. Click Applications at the top of the list of beta software. Click the Download button next to Xcode 11 . Wait for Xcode to finish downloading. Open iTunes from your Dock or Applications folder. Connect your iPhone to your Mac. Click the iPhone icon that appears in iTunes. You may be prompted to enter your iPhone's password on your phone. While holding down the Option key on your Mac's keyboard, click Check for Update . Click on Downloads in the sidebar, or whichever location you downloaded the iOS 13 restore image to. Click on the iOS 13 restore image . Click Open .

iTunes will now install iOS 13 onto your iPhone. This process will take some time, and you shouldn't unplug your iPhone from your Mac until the update is complete.

How to install the iOS beta using a profile.

Before you do anything else, make sure you have a developer account with Apple — without a paid account, you won't be able to download any non-Xcode betas.

Thanks to Apple's configuration profile, you can download iOS betas directly on your iPhone, no Mac required! (You can still install the iOS beta on your iPhone by connecting your device to iTunes, but you'll need to be running the Xcode beta first. The method listed below is generally a lot faster, with fewer wires.)

Go to developer.apple.com on your iPhone. Click on the "Discover" tab. Click on one of the operating system buttons in the bar near the top of the screen. Tap Download . Log in with your developer account's username and password. Go to the iOS 13 beta section and tap the download . This will start the process of downloading the iOS beta software profile on your iPhone. Tap Close. Open Settings . Tap Profile Downloaded . Tap Install . You may need to enter your Passcode . Agree to the Consent form and press Install once in the upper right corner, and once at the bottom of the screen.

Press Restart to apply the changes to your iPhone.

To install the beta itself, just visit system preferences.

Launch Settings from your Home screen, tap on General , then tap on Software Update . Once the update appears, tap on Download and Install .

Enter your Passcode .

Your iPhone will reboot to install iOS 13. There will be a couple of progress bars going across the screen. Sit tight, and let everything finish.

How to get started with iOS beta.

Once your iPhone reboots, it'll be running iOS the latest beta. There's a brief bit of setup you'll need to go through, however, as the system will have changed enough that it'll need your login to complete the update.

Tap Continue . Enter your Apple ID password . iCloud settings will update, so give it a minute. Tap Get Started .

Once that's done, you'll be on the Home screen and ready to rock the latest iOS beta.

Download ios 13 beta 5.

You can now download iOS 13.4.5 beta 2 and iPadOS 13.4.5 beta 2 IPSW links and OTA update. These latest releases by Cupertino-based Apple Inc. are made available for all compatible iPhone and iPad models. Here are the details on the company's latest software release.

Under normal circumstances, Apple would be making internal plans right now to unveil iOS 14 to a crowd of passionate developers from all over the world in just a matter of weeks. WWDC 2020 will still go ahead even with the current pandemic but it will follow an all-new online format.

Whether or not we still see the same announcements, including the unveiling of iOS 14, is anyone's guess. With that said, we still have Apple working tirelessly in improving things and that shows once again with this latest developer-facing release.

As with the initial release of iOS and iPadOS 13.4.5, this is all about bug fixes and performance improvements. On occasion, some quite bug issues manage to get through into production and into the hands of users. Some users have experienced some notable issues with previous releases and Apple could be addressing those. Additionally, this release will simply address underlying issues and niggles as well as try and get some performance gains out of the firmware on all compatible devices. Although small in what it actually includes, this is definitely something that developers should be downloading and checking out to see what it performs with their own apps and software on iPhone and iPad.

If this is something that interests you, either personally or professionally, then go and grab the release right now on your compatible iPhone or iPad as an OTA update via the Settings > General > Software Update section of the device itself.

Keep in mind that you will need to have the required beta configuration profile installed on that device. Alternatively, you can grab the latest release as an IPSW file from developer.apple.com by signing in with relevant credentials that have access to pre-release software and firmware distributed by Apple.

As always, we will also be grabbing the update from this end and getting it installed to a number of test devices to see how iOS 13.4.5 and iPadOS 13.4.5 beta 2 perform against expectations.

Download ios 13 beta 5.

You can now download iOS 13.5.5 beta 1, iPadOS 13.5.5 beta 1 IPSW links for Unc0ver 5.2.0 jailbreak on your iPhone 11, iPhone 11 Pro, iPhone 11 Pro Max, and all other iPhone, iPad and iPod touch devices. Here are the details.

As you may already know, Apple released iOS 13.5.1 last week to patch iOS 13.5 jailbreak. Apple also stopped signing iOS 13.5 earlier this week so that those who didn't upgrade or downgrade to 13.5 can no longer do so in order to jailbreak.

What Apple still hasn't done is stopped signing iOS 13.5.5 beta 1 as this firmware does not include the jailbreak patch introduced in iOS 13.5.1. While Apple has patched it in latest beta as well in the form of iOS 13.6 beta 2 release, iOS 13.5.5 beta 1 remains vulnerable and is still being signed so if you missed the jailbreak opportunity then, now is the time to do it.

Download links for iOS / iPadOS 13.5.5 beta 1 are as follows:

iPhone: iOS 13.5.5 beta 1 IPSW Links.

iPad: iPadOS 13.5.5 beta 1 IPSW Links.

iPod touch: iOS 13.5.5 beta 1 IPSW Links.

We will be back with complete guide on how to jailbreak iOS 13.5.5 beta 1 soon. Stay tuned.

Update x1: Our video tutorials, both using computer and no computer methods, are up now! Check them out below:
