Opera Mail 1.0 Build 1044.

Currently 4.43/5.

Use this Opera Software-developed application to manage your feeds, to manage a list of contacts, and to manage all your email clients. This is a properly good email client developed and offered for free by the company that came up with the most innovative web browser in the software world. Speaking about that, it must be mentioned that Opera Mail used to be a part of the Opera web browser. This changed when Opera 15 was rolled out to the public. Opera Mail was taken out of the browser, becoming available as a standalone application.

The Opera Mail installer for Windows is 11.5Mb in size, which is not much. When you run the aforementioned installer, a setup wizard shows up and guides you through the installation process. When you're done with the installation and you run Opera Mail for the first time, you will be presented with a New Account Wizard that will ask you what kind of account you would like to create: email, newsgroups, or import email.

As is expected from the company that invented tabbed browsing, Opera Mail has a tabbed interface. The interface is divided into three panels. The one to the far left lists all your messages, your labels, and so on. From this panel, if you select Received, a list of all the emails you received are presented in the middle panel. And if you select an email from the list, its contents will be displayed on the panel to the far right.

Lots of useful functionality is put at your disposal for free by Opera Mail: monitor multiple email accounts, keep all your emails nicely sorted, reply and send out email messages, assign labels to messages, low-bandwidth mode, read and manage feeds, customize the interface, and so on. Suffice it to say that Opera Mail provides all the functionality you would expect from a mail client. Opera Mail is a properly good email client and feed reader. It has an elegant interface, it puts lost of useful functionality at your fingertips, and it is offered for free.

Pros Downloading and installing Opera Mail on your PC will take little of your time. Opera Mail is a mail and news client, meaning you can use it to manage all your emails and all your feeds. Opera Mail has an elegant, user friendly, and customizable interface. Opera Mail is freeware.

Opera Mail.

Check out your e-mails and read your news feeds using an application that integrates all the necessary functions in a single interface.

Those who have several e-mail accounts on various services can manage all of them from a single interface as long as they succeed in getting to terms with one of the dedicated e-mail clients out there. There are quite a few programs of this kind available on the market and one of the freshest releases to date is Opera Mail.

Some of you might be actually familiar with it if you ever used this built-in function of the older editions of Opera's proprietary web browser. It is now available on its own and, fortunately, has all the good parts in place.

The interface is nice and simple, with customizable views so you can view the mail folders, mailing lists, the available labels, attachments and news feeds listed in the same panel. There is enough space to accommodate the list of items that is included in each category and also a preview of the content form a selected message.

Composing new e-mails can be done from the dedicated window, while with Opera Mail you can import and export various types of content. Thus, you can add your favorite feeds, get the contacts' list and even the saved messages, provided they are in a compatible format.

Insofar as the layout and sorting options are concerned, you have many options at your disposal, as Opera Mail offers 3 ways of displaying messages and detailed grouping and categorization alternatives.

Setting up an account inside this software is not at all difficult, as is the case with most dedicated e-mail clients. You only have to supply the necessary data concerning your account and the incoming IMAP and outgoing SMTP servers to complete the procedure in a couple of minutes.

All in all, Opera Mail can actually be a very good alternative to the established applications of this kind as it comes with very good features and is quite easy to use, even for those with less experience.

How to use Opera's Tablet Mode in Windows 10.

Competition among web browsers for Windows 10 is on the rise, with developers constantly coming up with new features in order to stay competitive.

Opera is one of the browsers fully committed to Windows 10, constantly trying to bring the best possible experience to the users of Microsoft's latest operating system.

Opera constantly adapted its features to Windows 10 and that shows because the browser is definitely one of the best browsers for Microsoft's OS.

And today, we're going to talk about Opera's Tablet Mode feature in Windows 10 and what do you need to know in order to use it.

How can I use the Opera Tablet Mode in Windows 10?

1. Use the automatic feature.

One of the excellent features of the Opera browser is the ability to recognize when Windows 10 is set to Tablet Mode.

When Windows 10 is in Tablet Mode, the full-screen option will show up in Opera and it will become optimized for touch screens.

By doing this, you will have a feeling that you're using a Universal app from the Store.

So, you don't have to do a thing to use Opera in Tablet Mode, it just switches automatically to touch control when it detects that Windows 10 works in that mode.

Opera is a free browser that works perfectly in Windows 10 but also on all other media such as tablets or smartphones so give it a try right now.

Opera.

Opera is an excellent browser that switches into Tablet Mode and works on almost all devices and media.

2. How to switch Windows 10 in Tablet Mode.

Press the Windows Key + A to start the Action Center . Click on the Tablet mode button to switch Windows 10 to tablet mode.

Of course, if you don't have a touchscreen you won't find the Tablet Mode button. However, if you have a 2-in-1 device with a keyboard, all you need to do to switch to this mode is to detach the keyboard.

You set-up the Tablet Mode by entering the Settings app, then selecting System, and clicking on the Tablet option from the left pane.

You will be able to make all sorts of modifications like deciding when the device enters the Tablet Mode, or if you want the device to remember the Tablet Mode stance when you sign in.

If you need more information about the Windows 10 Tablet Mode we have an excellent guide for that.

3. Other important Opera features.

One of the main advantages of Opera over other browsers is the inclusion of a full-featured, free VPN service that also doesn't have a bandwidth limitation.

That is a highly in-demand feature nowadays as we need more and more online privacy and security protection.

For those unaware of how a VPN works, that is a tool that redirects all your online traffic through safe servers throughout the world in order to protect your online identity even from your ISP.

Opera also has integrated social networking features like dedicated buttons for WhatsApp, Messenger and Instagram, great tab management and many more.

Tell us in the comments below: what feature would you like to see in Opera next?

Opera Mail review.

A functional free email client in need of modernizing.

By Cat Ellis 12 May 2017.

Our Verdict.

A well designed free email client with a particularly good tagging system, but it's starting to show its age. Simple importing from more modern clients would be a welcome addition, as would one-click setup for popular email providers.

Mailbox lists and directories are well organized No limit on the number of connected email accounts Customizable tagging system.

Against.

Setup requires manual input of some server details Doesn't support import from most modern email clients.

Do you struggle to keep on top of your emails? Hundreds of unread and disorganized messages giving you a headache? Opera Mail could be the solution.

Operating system: Windows, Mac, Linux.

Version: 1.

Opera Mail is a free email client originally bundled with the Opera web browser, but now in development as a standalone project. It's a great tool for keeping multiple email accounts organized, avoiding the need to open multiple browser tabs. It also stores an offline backup of your messages so you don't need to worry about accidentally deleting the email about that critical job interview, or the order confirmation from that misguided 2am eBay purchase.

If you already use an email client, there's a wizard that makes it easy to import your messages and contacts. This tool sounds good in principle, and it supports Mozilla Thunderbird, but unfortunately most of the other clients listed are quite outdated, including Netscape and the geriatric Eudora.

This is reflective of Opera Mail as a whole – it's a very well made, smart email client, but needs a thorough refresh to bring it up to date.

User experience.

Upon launching Opera Mail for the first time, you'll be given three choices: email, newsgroups (yes, really) and import email.

Setting up an email account isn't quite as straightforward as it is in eM Client or MailBird Free, but it's still fairly easy. Enter your name and email address, then your login name and password. The incoming and outgoing server names will be populated automatically (usually correctly), and you can choose whether to leave the messages on the server if you delete them. There's also the option to use a secure connection – something that's missing from most clients.

Further options become available once the account is set up, including a very useful low-bandwidth mode that doesn't load attachments – ideal if you're using your smartphone as a Wi-Fi hotspot and don't want it to chew through your whole data allowance.

Incoming messages are aggregated in a central inbox, and individual account folders are listed below. Opera Mail's three-pane default layout is very clear (accounts and folders on the left, messages received in the middle, and currently open message on the right), and the labelling system is much more useful than Gmail's system of simply starring emails for attention.

We really like Opera Mail – it's just a shame it's starting to feel a little unloved. With a little modernization, it could easily stand alongside the slick eM Client and Mailbird.

The competition.
